Revision History

| Revision No. | History | Draft Date | Remark |
|--------------|---|------------|--------|
| 0.1 | Initial Release | Apr. 2015 | |
| 1.0 | Added development plan (1Rx8/2Rx8 ECC) Updated IDD specifcaion | Aug. 2015 | |

Description

SK hynix Unbuffered DDR3 SDRAM DIMMs (Unbuffered Double Data Rate Synchronous DRAM Dual In-Line Memory Modules) are low power, high-speed operation memory modules that use DDR3 SDRAM devices. These Unbuffered SDRAM DIMMs are intended for use as main memory when installed in systems such as PCs and workstations.

Feature

- VDD=1.5V +/- 0.075V
- VDDQ=1.5V +/- 0.075V
- VDDSPD=3.0V to 3.6V
- 8 internal banks
- Data transfer rates: PC3-14900, PC3-12800, PC3-10600, PC3-8500
- Bi-directional Differential Data Strobe
- 8 bit pre-fetch
- Burst Length (BL) switch on-the-fly: BL 8 or BC (Burst Chop) 4
- Supports ECC error correction and detection
- On Die Termination (ODT) supported
- Temperature sensor with integrated SPD (Serial Presence Detect) EEPROM
- This product is in Compliance with the RoHS directive

Ordering Information

| Part Number | Density | Organization | Component Composition | # of ranks |
|------------------------|---------|--------------|------------------------|------------|
| HMT451U6DFR8C-H9/PB/RD | 4GB | 512Mx64 | 512Mx8(H5TQ4G83DFR)*8 | 1 |
| HMT451U7DFR8C-H9/PB/RD | 4GB | 512Mx72 | 512Mx8(H5TQ4G83DFR)*9 | 1 |
| HMT41GU6DFR8C-H9/PB/RD | 8GB | 1Gx64 | 512Mx8(H5TQ4G83DFR)*16 | 2 |
| HMT41GU7DFR8C-H9/PB/RD | 8GB | 1Gx72 | 512Mx8(H5TQ4G83DFR)*18 | 2 |

Key Parameters

| MT/s | Grade | tCK (ns) | CAS Latency (tCK) | tRCD (ns) | tRP (ns) | tRAS (ns) | tRC (ns) | CL-tRCD-tRP |
|------------------|-------|----------|-------------------|--------------------|--------------------|-----------|--------------------|-------------|
| DDR3-1066 | -G7 | 1.875 | 7 | 13.125 | 13.125 | 37.5 | 50.625 | 7-7-7 |
| DDR3-1333 | -H9 | 1.5 | 9 | 13.5 (13.125)* | 13.5 (13.125)* | 36 | 49.5 (49.125)* | 9-9-9 |
| DDR3-1600 | -PB | 1.25 | 11 | 13.75 (13.125)* | 13.75 (13.125)* | 35 | 48.75 (48.125)* | 11-11-11 |
| DDR3-1866 | -RD | 1.07 | 13 | 13.91 (13.125)* | 13.91 (13.125)* | 34 | 47.91 (47.125)* | 13-13-13 |

*SK hynix DRAM devices support optional downbinning to CL11, CL9 and CL7. SPD setting is programmed to match.

Speed Grade

| Grade | Frequency [Mbps] | | | | | | | | Remark |
|-------|------------------|------|------|------|------|------|------|------|--------|
| | CL6 | CL7 | CL8 | CL9 | CL10 | CL11 | CL12 | CL13 | |
| -G7 | 800 | 1066 | 1066 | | | | | | |
| -H9 | 800 | 1066 | 1066 | 1333 | 1333 | | | | |
| -PB | 800 | 1066 | 1066 | 1333 | 1333 | 1600 | | | |
| -RD | 800 | 1066 | 1066 | 1333 | 1333 | 1600 | | 1866 | |

Address Table

| | 4GB(1Rx8) | 8GB(2Rx8) | 4GB(1Rx8) | 8GB(2Rx8) |
|-----------------------|-----------|-----------|-----------|-----------|
| Refresh Method | 8K/64ms | 8K/64ms | 8K/64ms | 8K/64ms |
| Row Address | A0-A15 | A0-A15 | A0-A15 | A0-A15 |
| Column Address | A0-A9 | A0-A9 | A0-A9 | A0-A9 |
| Bank Address | BA0-BA2 | BA0-BA2 | BA0-BA2 | BA0-BA2 |
| Page Size | 1KB | 1KB | 1KB | 1KB |

Pin Descriptions

| Pin Name | Description | Pin Name | Description |
|------------------|--|----------|---|
| A0–A15 | SDRAM address bus | SCL | I ² C serial bus clock for EEPROM |
| BA0–BA2 | SDRAM bank select | SDA | I ² C serial bus data line for EEPROM |
| <u>RAS</u> | SDRAM row address strobe | SA0–SA2 | I ² C slave address select for EEPROM |
| <u>CAS</u> | SDRAM column address strobe | VDD* | SDRAM core power supply |
| <u>WE</u> | SDRAM write enable | VDDQ* | SDRAM I/O Driver power supply |
| <u>S0–S1</u> | DIMM Rank Select Lines | VREFDQ | SDRAM I/O reference supply |
| CKE0–CKE1 | SDRAM clock enable lines | VREFCA | SDRAM command/address reference supply |
| ODT0–ODT1 | On-die termination control lines | VSS | Power supply return (ground) |
| DQ0–DQ63 | DIMM memory data bus | VDDSPD | Serial EEPROM positive power supply |
| CB0–CB7 | DIMM ECC check bits | NC | Spare pins (no connect) |
| DQS0–DQS8 | SDRAM data strobes (positive line of differential pair) | TEST | Memory bus analysis tools (unused on memory DIMMS) |
| <u>DQS0–DQS8</u> | SDRAM data strobes (negative line of differential pair) | RESET | Set DRAMs to Known State |
| DM0–DM8 | SDRAM data masks/high data strobes (x8-based x72 DIMMs) | VTT | SDRAM I/O termination supply |
| CK0–CK1 | SDRAM clocks (positive line of differential pair) | RSVD | Reserved for future use |
| <u>CK0–CK1</u> | SDRAM clocks (negative line of differential pair) | - | - |

***The VDD and VDDQ pins are tied common to a single power-plane on these designs**

Input/Output Functional Descriptions

| Symbol | Type | Polarity | Function |
|------------------------------|--------|-----------------------|--|
| CK0–CK1 CK0– $\bar{C}K_1$ | SSTL | Differential crossing | CK and $\bar{C}K$ are differential clock inputs. All the DDR3 SDRAM addr/cntl inputs are sampled on the crossing of positive edge of CK and negative edge of $\bar{C}K$. Output (read) data is reference to the crossing of CK and $\bar{C}K$ (Both directions of crossing). |
| CKE0–CKE1 | SSTL | Active High | Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode. |
| $\bar{S}0–\bar{S}1$ | SSTL | Active Low | Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. This signal provides for external rank selection on systems with multiple ranks. |
| RAS, CAS, WE | SSTL | Active Low | $\bar{R}AS$, $\bar{C}AS$, and $\bar{W}E$ (ALONG WITH \bar{S}) define the command being entered. |
| ODT0–ODT1 | SSTL | Active High | When high, termination resistance is enabled for all DQ, DQS, $\bar{D}QS$ and DM pins, assuming this function is enabled in the Mode Register 1 (MR1). |
| VREFDQ | Supply | | Reference voltage for SSTL15 I/O inputs. |
| VREFCA | Supply | | Reference voltage for SSTL 15 command/address inputs. |
| VDDQ | Supply | | Power supply for the DDR3 SDRAM output buffers to provide improved noise immunity. For all current DDR3 unbuffered DIMM designs, VDDQ shares the same power plane as VDD pins. |
| BA0–BA2 | SSTL | — | Selects which SDRAM bank of eight is activated. |
| A0–A15 | SSTL | — | During a Bank Activate command cycle, Address input defines the row address (RA0–RA15). During a Read or Write command cycle, Address input defines the column address. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0, BA1, BA2 defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0, BA1, BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0, BA1 or BA2. If AP is low, BA0, BA1 and BA2 are used to define which bank to precharge. A12(BC) is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed (HIGH, no burst chop; LOW, burst chopped). |
| DQ0–DQ63, CB0–CB7 | SSTL | — | Data and Check Bit Input/Output pins. |
| DM0–DM8 | SSTL | Active High | DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading. |
| VDD, Vss | Supply | | Power and ground for the DDR3 SDRAM input buffers, and core logic. VDD and VDDQ pins are tied to Vdd/VddQ planes on these modules. |

| Symbol | Type | Polarity | Function |
|------------------------|-------------|-----------------------|--|
| DQS0-DQS8 DQS0-DQS8 | SSTL | Differential crossing | Data strobe for input and output data. |
| SA0-SA2 | | — | These signals are tied at the system planar to either Vss or VDDSPD to configure the serial SPD EEPROM address range. |
| SDA | | — | This bidirectional pin is used to transfer data into or out of the SPD EEPROM. An external resistor may be connected from the SDA bus line to VDDSPD to act as a pullup on the system board. |
| SCL | | — | This signal is used to clock data into and out of the SPD EEPROM. An external resistor may be connected from the SCL bus line to VDDSPD to act as a pullup on the system board. |
| VDDSPD | Supply | | Power supply for SPD EEPROM. This supply is separate from the VDD/VDDQ power plane. EEPROM supply is operable from 3.0V to 3.6V. |

NC = No Connect; RFU = Reserved Future Use

1. NC pins should not be connected to anything on the DIMM, including bussing within the NC group.
2. Address pins A3–A8 and BA0 and BA1 can be mirrored or not mirrored.

On DIMM Thermal Sensor

The DDR3 SDRAM DIMM temperature is monitored by integrated thermal sensor. The integrated thermal sensor comply with JEDEC "TSE2002av, Serial Presence Detect with Temperature Sensor".

Connection of Thermal Sensor

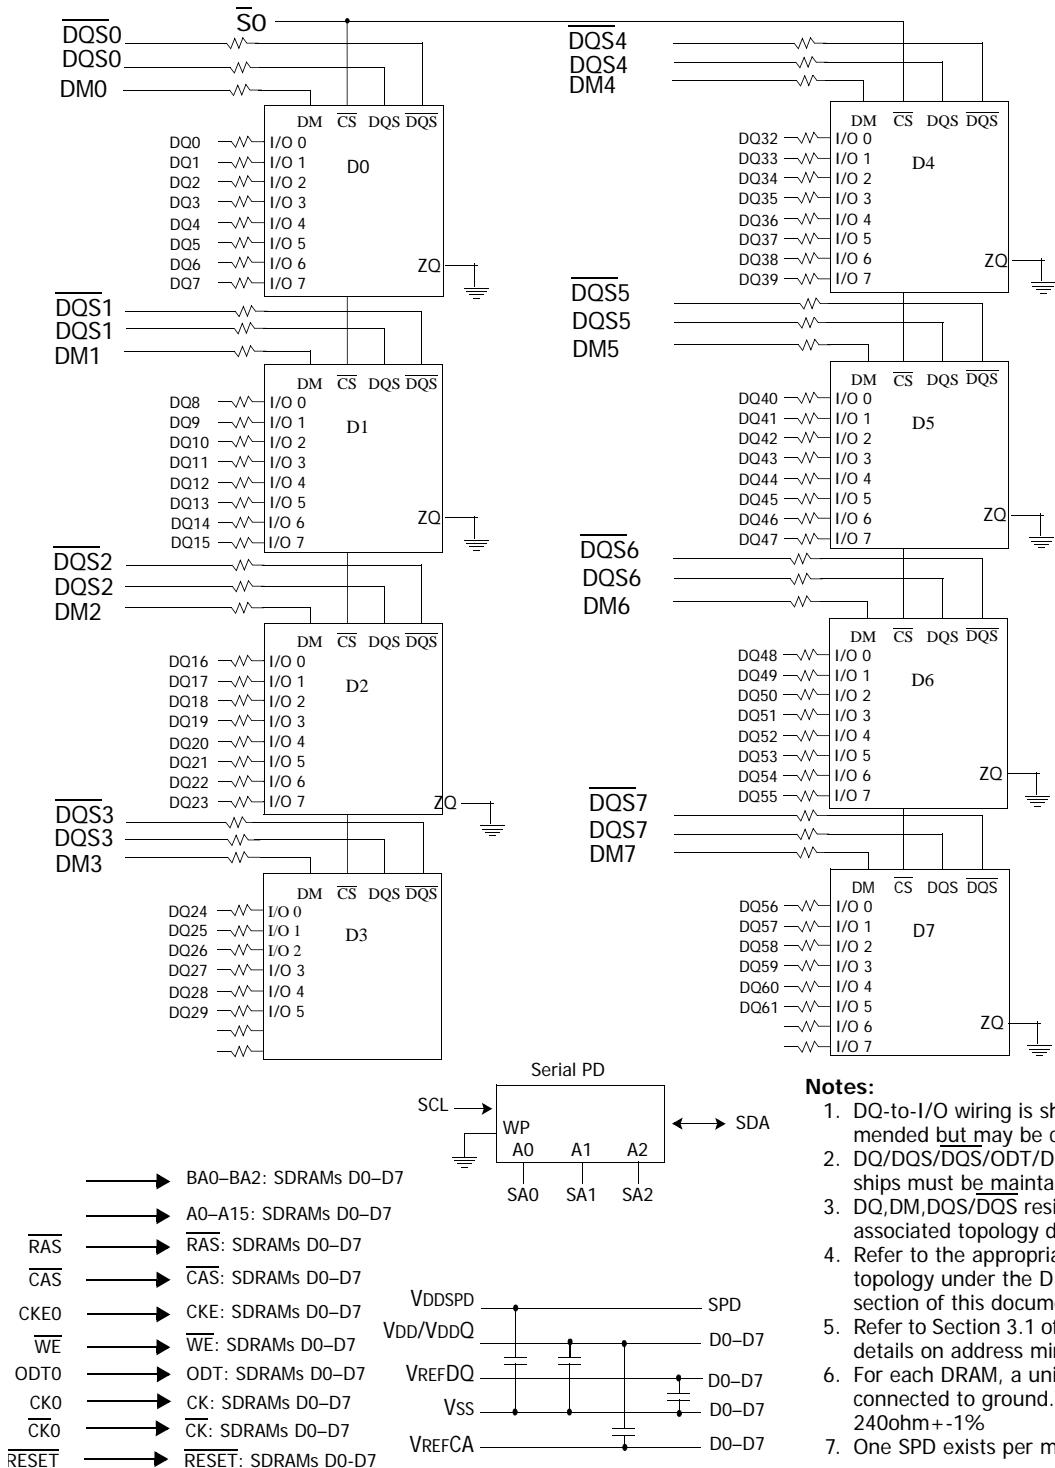

Temperature-to-Digital Conversion Performance

| Parameter | Condition | Min | Typ | Max | Unit |
|---------------------------------------|--|-----|-----------|-----------|--------------------|
| Temperature Sensor Accuracy (Grade B) | Active Range, $75^{\circ}\text{C} < T_A < 95^{\circ}\text{C}$ | - | ± 0.5 | ± 1.0 | $^{\circ}\text{C}$ |
| | Monitor Range, $40^{\circ}\text{C} < T_A < 125^{\circ}\text{C}$ | - | ± 1.0 | ± 2.0 | $^{\circ}\text{C}$ |
| | $-20^{\circ}\text{C} < T_A < 125^{\circ}\text{C}$ | - | ± 2.0 | ± 3.0 | $^{\circ}\text{C}$ |
| Resolution | | | 0.25 | | $^{\circ}\text{C}$ |

Functional Block Diagram

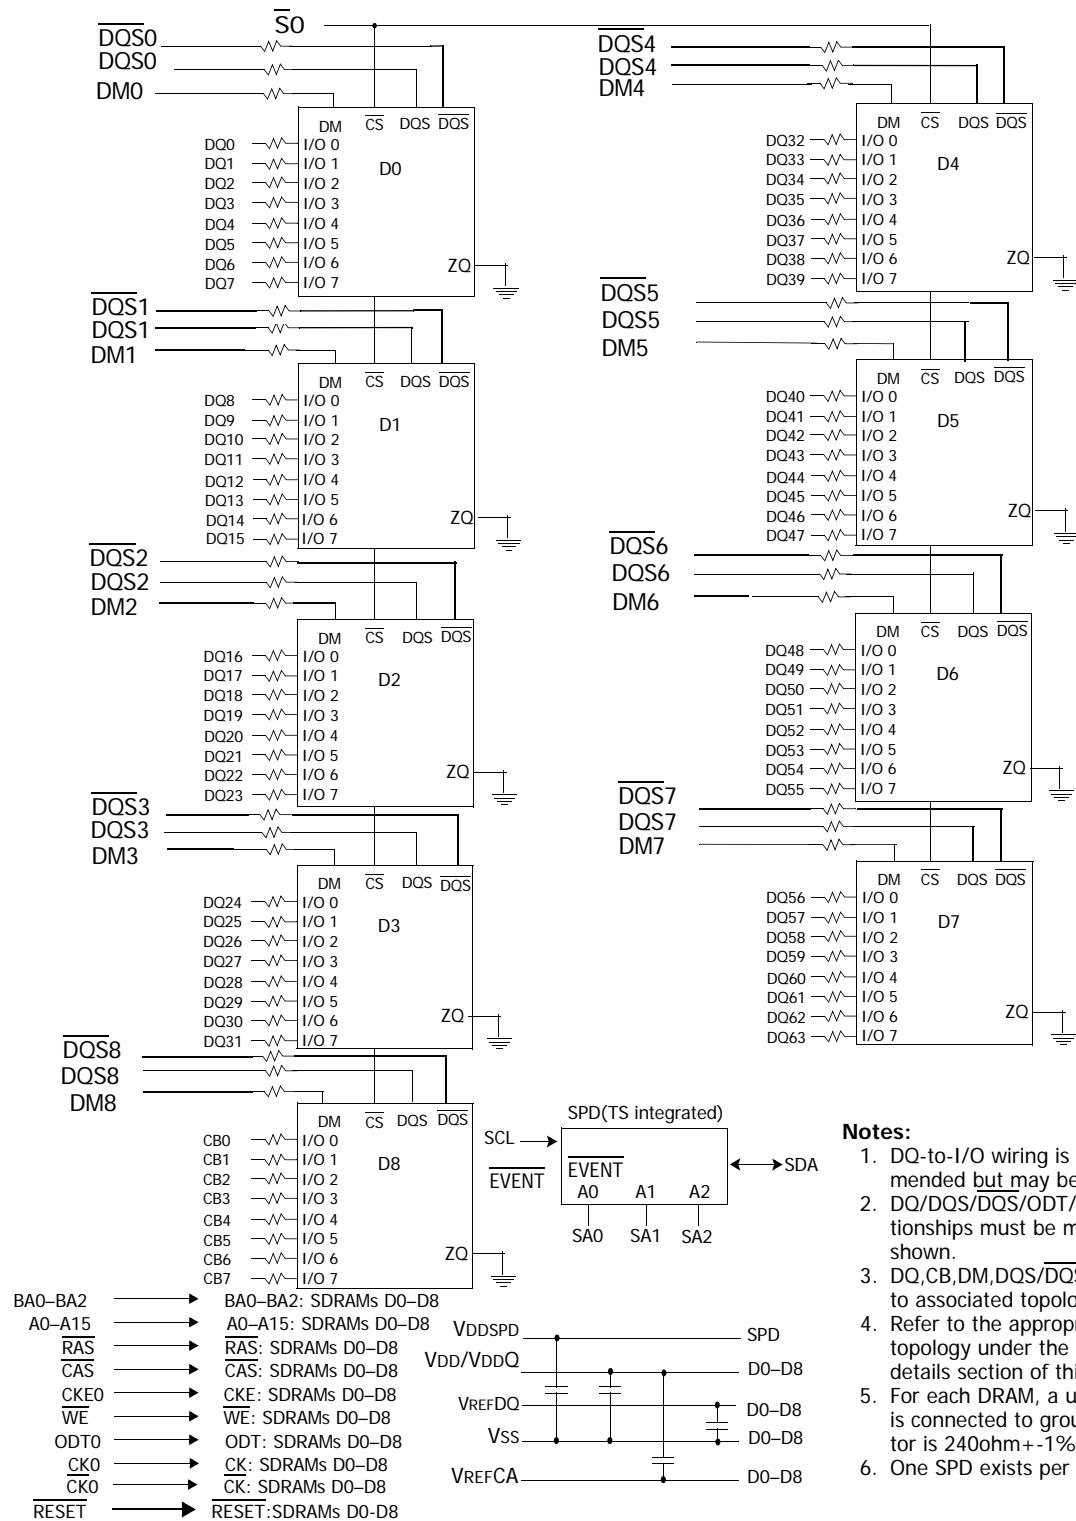

4GB, 512Mx64 Module(1Rank of x8)

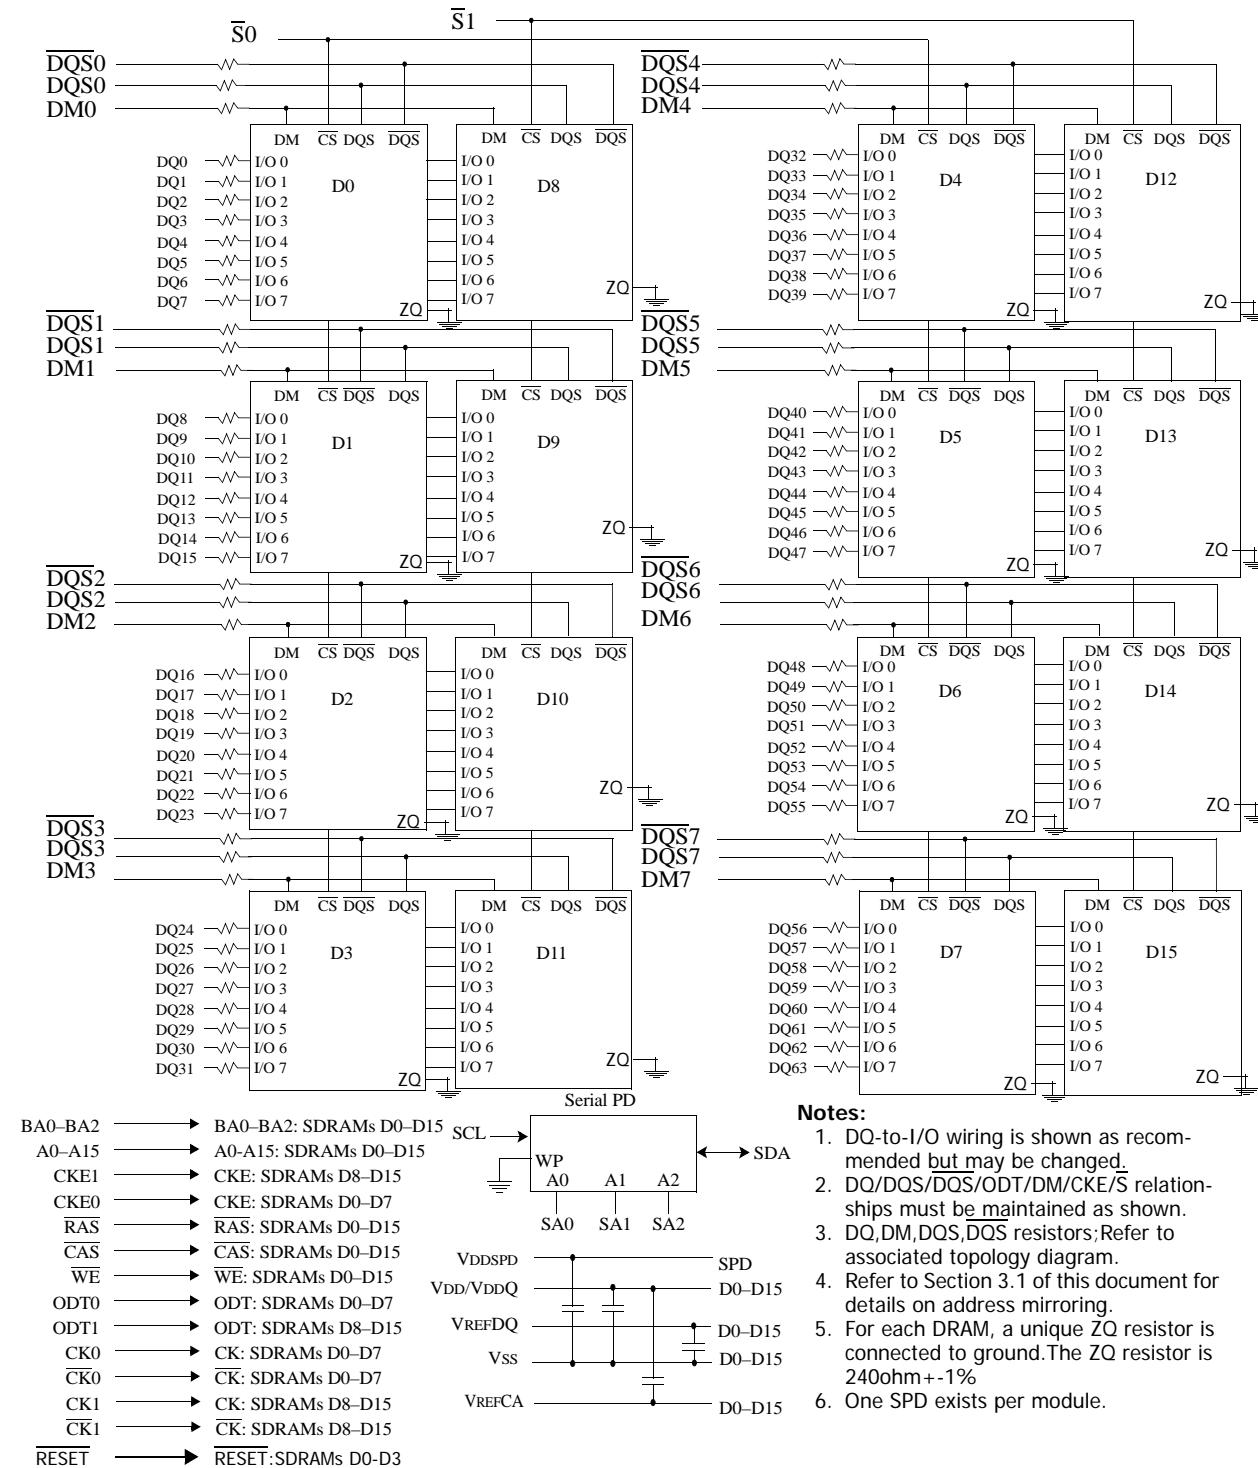

Notes:

1. DO-to-I/O wiring is shown as recommended but may be changed.
2. DO/DQS/DQS/ODT/DM/CKE/S relationships must be maintained as shown.
3. DQ, DM, DQS/DQS resistors; Refer to associated topology diagram.
4. Refer to the appropriate clock wiring topology under the DIMM wiring details section of this document.
5. Refer to Section 3.1 of this document for details on address mirroring.
6. For each DRAM, a unique ZQ resistor is connected to ground. The ZQ resistor is 240ohm+/-1%
7. One SPD exists per module.

8GB, 1Gx64 Module(2Rank of x8)

8GB, 1Gx72 Module(2Rank of x8)

Absolute Maximum Ratings

Absolute Maximum DC Ratings

Absolute Maximum DC Ratings

| Symbol | Parameter | Rating | Units | Notes |
|------------------------------------|-------------------------------------|-----------------|-------|-------|
| VDD | Voltage on VDD pin relative to Vss | - 0.4 V ~ 1.8 V | V | 1, 3 |
| VDDQ | Voltage on VDDQ pin relative to Vss | - 0.4 V ~ 1.8 V | V | 1, 3 |
| V _{IN} , V _{OUT} | Voltage on any pin relative to Vss | - 0.4 V ~ 1.8 V | V | 1 |
| T _{STG} | Storage Temperature | -55 to +100 | °C | 1, 2 |

Notes:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
3. VDD and VDDQ must be within 300mV of each other at all times; and VREF must not be greater than 0.6XVDDQ, When VDD and VDDQ are less than 500mV; VREF may be equal to or less than 300mV.

DRAM Component Operating Temperature Range

Temperature Range

| Symbol | Parameter | Rating | Units | Notes |
|-------------------|------------------------------------|----------|-------|-------|
| T _{OPER} | Normal Operating Temperature Range | 0 to 85 | °C | 1,2 |
| | Extended Temperature Range | 85 to 95 | °C | 1,3 |

Notes:

1. Operating Temperature T_{OPER} is the case surface temperature on the center / top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 - 85°C under all operating conditions.
3. Some applications require operation of the DRAM in the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
 - a. Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 µs. It is also possible to specify a component with 1X refresh (tREFI to 7.8µs) in the Extended Temperature Range. Please refer to the DIMM SPD for option availability
 - b. If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b). DDR3 SDRAMs support Extended Temperature Range and please refer to component datasheet and/or the DIMM SPD for tFEFI requirements in the Extended Temperature Range.

AC & DC Operating Conditions

Recommended DC Operating Conditions

Recommended DC Operating Conditions

| Symbol | Parameter | Rating | | | Units | Notes |
|--------|---------------------------|--------|-------|-------|-------|-------|
| | | Min. | Typ. | Max. | | |
| VDD | Supply Voltage | 1.425 | 1.500 | 1.575 | V | 1,2 |
| VDDQ | Supply Voltage for Output | 1.425 | 1.500 | 1.575 | V | 1,2 |

Notes:

1. Under all conditions, VDDQ must be less than or equal to VDD.
2. VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together.

AC & DC Input Measurement Levels

AC and DC Logic Input Levels for Single-Ended Signals

AC and DC Input Levels for Single-Ended Command and Address Signals

Single Ended AC and DC Input Levels for Command and ADDress

| Symbol | Parameter | DDR3-800/1066/1333/1600 | | DDR3-1866 | | Unit | Notes |
|------------------------|---------------------------------------|-------------------------|--------------|--------------|--------------|------|---------|
| | | Min | Max | Min | Max | | |
| VIH.CA(DC100) | DC input logic high | Vref + 0.100 | VDD | Vref + 0.100 | VDD | V | 1, 5 |
| VIL.CA(DC100) | DC input logic low | VSS | Vref - 0.100 | VSS | Vref - 0.100 | V | 1, 6 |
| VIH.CA(AC175) | AC input logic high | Vref + 0.175 | Note2 | - | - | V | 1, 2, 7 |
| VIL.CA(AC175) | AC input logic low | Note2 | Vref - 0.175 | - | - | V | 1, 2, 8 |
| VIH.CA(AC150) | AC Input logic high | Vref + 0.150 | Note2 | - | - | V | 1, 2, 7 |
| VIL.CA(AC150) | AC input logic low | Note2 | Vref - 0.150 | - | - | V | 1, 2, 8 |
| VIH.CA(AC135) | AC input logic high | - | - | Vref + 0.135 | Note2 | V | 1, 2, 7 |
| VIL.CA(AC135) | AC input logic low | - | - | Note2 | Vref - 0.135 | V | 1, 2, 8 |
| VIH.CA(AC125) | AC Input logic high | - | - | Vref + 0.125 | Note2 | mV | 1, 2, 7 |
| VIL.CA(AC125) | AC input logic low | - | - | Note2 | Vref - 0.125 | mV | 1, 2, 8 |
| V _{RefCA(DC)} | Reference Voltage for ADD, CMD inputs | 0.49 * VDD | 0.51 * VDD | 0.49 * VDD | 0.51 * VDD | V | 3, 4 |

Notes:

1. For input only pins except $\overline{\text{RESET}}$, Vref = V_{refCA} (DC).
2. Refer to "Overshoot and Undershoot Specifications" on page 30.
3. The ac peak noise on V_{Ref} may not allow V_{Ref} to deviate from V_{RefCA(DC)} by more than +/-1% VDD (for reference: approx. +/- 15 mV).
4. For reference: approx. VDD/2 +/- 15 mV.
5. VIH(dc) is used as a simplified symbol for VIH.CA(DC100)
6. VIL(dc) is used as a simplified symbol for VIL.CA(DC100)
7. VIH(ac) is used as simplified symbol for VIH.CA(AC175), VIH.CA(AC150), VIH.CA(AC135), and VIH.CA(AC125); VIH.CA(AC175) value is used when Vref + 0.175V is referenced, VIH.CA(AC150) value is used when Vref + 0.150V is referenced, VIH.CA(AC135) value is used when Vref + 0.135V is referenced, and VIH.CA(AC125) value is used when Vref + 0.125V is referenced.
8. VIL(ac) is used as simplified symbol for VIL.CA(AC175), VIL.CA(AC150), VIL.CA(AC135), and VIL.CA(AC125); VIL.CA(AC175) value is used when Vref - 0.175V is referenced, VIL.CA(AC150) value is used when Vref - 0.150V is referenced, VIL.CA(AC135) value is used when Vref - 0.135V is referenced, and VIL.CA(AC125) value is used when Vref - 0.125V is referenced.

AC and DC Input Levels for Single-Ended Signals

DDR3 SDRAM will support two Vih/Vil AC levels for DDR3-800 and DDR3-1066 as specified in the table below. DDR3 SDRAM will also support corresponding tDS values (Table 43 and Table 51 in "DDR3 Device Operation") as well as derating tables in Table 46 of "DDR3 Device Operation" depending on Vih/Vil AC levels.

Single Ended AC and DC Input Levels for DQ and DM

| Symbol | Parameter | DDR3-800/1066 | | DDR3-1333/1600 | | DDR3-1866 | | Unit | Notes |
|-----------------|--|---------------|--------------|----------------|--------------|--------------|--------------|------|---------|
| | | Min | Max | Min | Max | Min | Max | | |
| VIH.DQ(DC100) | DC input logic high | Vref + 0.100 | VDD | Vref + 0.100 | VDD | Vref + 0.100 | VDD | V | 1, 5 |
| VIL.DQ(DC100) | DC input logic low | VSS | Vref - 0.100 | VSS | Vref - 0.100 | VSS | Vref - 0.100 | V | 1, 6 |
| VIH.DQ(AC175) | AC input logic high | Vref + 0.175 | Note2 | - | - | - | - | V | 1, 2, 7 |
| VIL.DQ(AC175) | AC input logic low | Note2 | Vref - 0.175 | - | - | - | - | V | 1, 2, 8 |
| VIH.DQ(AC150) | AC Input logic high | Vref + 0.150 | Note2 | Vref + 0.150 | Note2 | Vref + 0.150 | Note2 | V | 1, 2, 7 |
| VIL.DQ(AC150) | AC input logic low | Note2 | Vref - 0.150 | Note2 | Vref - 0.150 | Note2 | Vref - 0.150 | V | 1, 2, 8 |
| VIH.CA(AC135) | AC input logic high | - | - | - | - | Vref + 0.135 | Note2 | mV | 1, 2, 7 |
| VIL.CA(AC135) | AC input logic low | - | - | - | - | Note2 | Vref - 0.135 | mV | 1, 2, 8 |
| $V_{RefDQ(DC)}$ | Reference Voltage for DQ, DM inputs | $0.49 * VDD$ | $0.51 * VDD$ | $0.49 * VDD$ | $0.51 * VDD$ | $0.49 * VDD$ | $0.51 * VDD$ | V | 3, 4 |

Notes:

1. $Vref = VrefDQ (DC)$.
2. Refer to "Overshoot and Undershoot Specifications" on page 30.
3. The ac peak noise on V_{Ref} may not allow V_{Ref} to deviate from $V_{RefDQ(DC)}$ by more than +/-1% VDD (for reference: approx. +/- 15 mV).
4. For reference: approx. $VDD/2$ +/- 15 mV.
5. VIH(dc) is used as a simplified symbol for VIH.DQ(DC100)
6. VIL(dc) is used as a simplified symbol for VIL.DQ(DC100)
7. VIH(ac) is used as simplified symbol for VIH.DQ(AC175), VIH.DQ(AC150), and VIH.DQ(AC135); VIH.DQ(AC175) value is used when $Vref + 0.175V$ is referenced, VIH.DQ(AC150) value is used when $Vref + 0.150V$ is referenced, and VIH.DQ(AC135) value is used when $Vref + 0.135V$ is referenced.
8. VIL(ac) is used as simplified symbol for VIL.DQ(AC175), VIL.DQ(AC150), and VIL.DQ(AC135); VIL.DQ(AC175) value is used when $Vref - 0.175V$ is referenced, VIL.DQ(AC150) value is used when $Vref - 0.150V$ is referenced, and VIL.DQ(AC135) value is used when $Vref - 0.135V$ is referenced.

Vref Tolerances

The dc-tolerance limits and ac-noise limits for the reference voltages V_{RefCA} and V_{RefDQ} are illustrated in figure below. It shows a valid reference voltage $V_{Ref}(t)$ as a function of time. (V_{Ref} stands for V_{RefCA} and V_{RefDQ} likewise).

$V_{Ref(DC)}$ is the linear average of $V_{Ref}(t)$ over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements in the table "Differential AC and DC Input Levels" on page 21. Furthermore $V_{Ref}(t)$ may temporarily deviate from $V_{Ref(DC)}$ by no more than +/- 1% VDD.

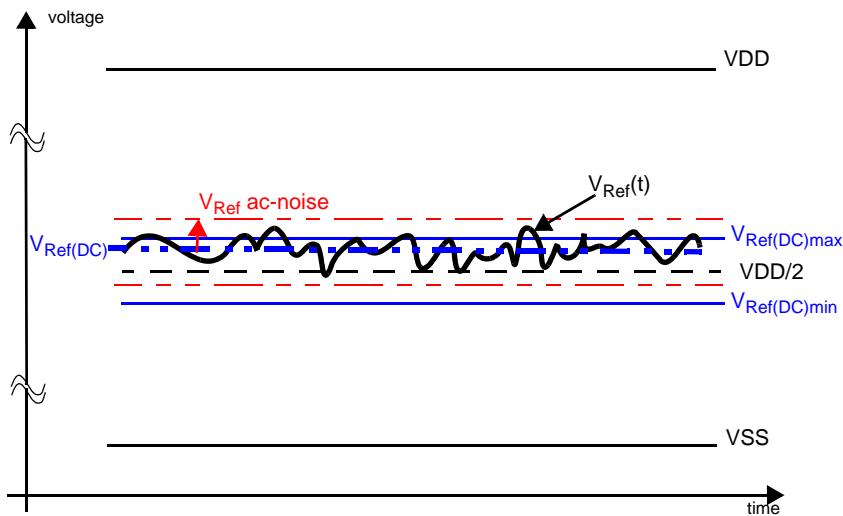

Illustration of $V_{Ref(DC)}$ tolerance and V_{Ref} ac-noise limits

The voltage levels for setup and hold time measurements $V_{IH(AC)}$, $V_{IH(DC)}$, $V_{IL(AC)}$, and $V_{IL(DC)}$ are dependent on V_{Ref} .

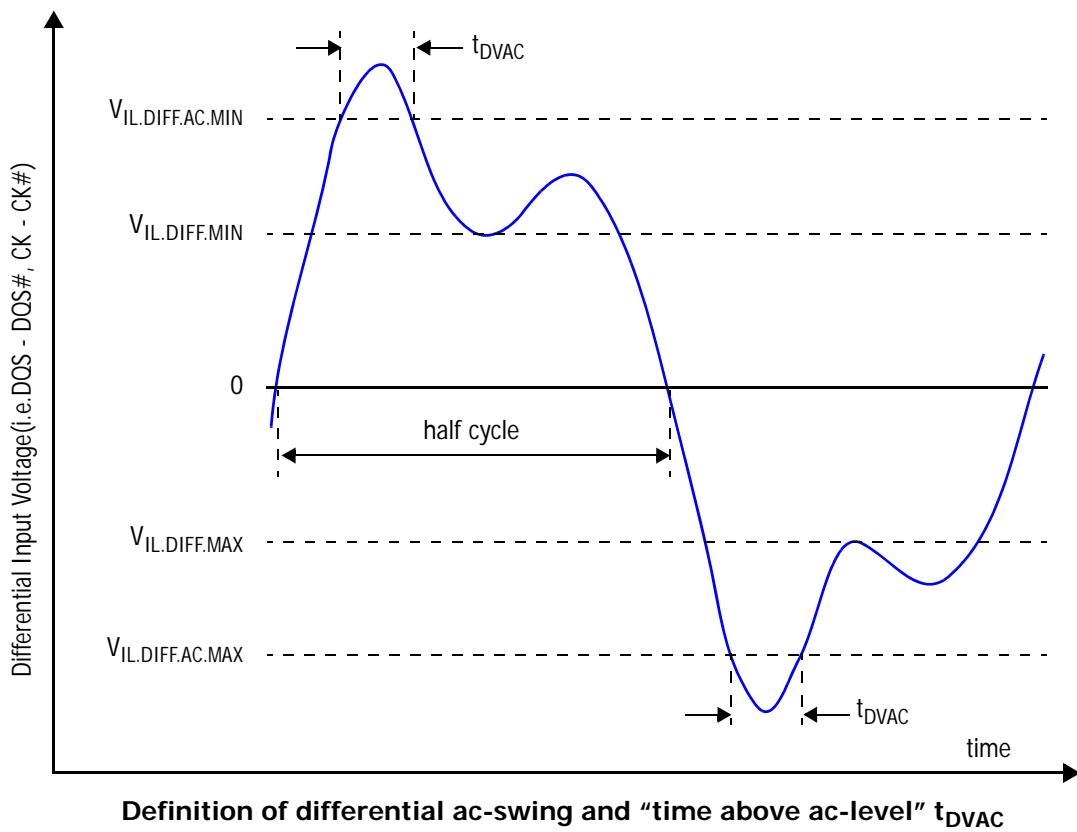

" V_{Ref} " shall be understood as $V_{Ref(DC)}$, as defined in figure above.

This clarifies that dc-variations of V_{Ref} affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for $V_{Ref(DC)}$ deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with V_{Ref} ac-noise. Timing and voltage effects due to ac-noise on V_{Ref} up to the specified limit (+/- 1% of VDD) are included in DRAM timings and their associated deratings.

AC and DC Logic Input Levels for Differential Signals

Differential signal definition

Differential swing requirements for clock (\overline{CK}) and strobe ($DQS - \overline{DQS}$) Differential AC and DC Input Levels

| Symbol | Parameter | DDR3-800, 1066, 1333, 1600, 1866 | | Unit | Notes |
|--------------|------------------------------|----------------------------------|-----------------------|------|-------|
| | | Min | Max | | |
| VIHdiff | Differential input high | + 0.180 | Note 3 | V | 1 |
| VILdiff | Differential input logic low | Note 3 | - 0.180 | V | 1 |
| VIHdiff (ac) | Differential input high ac | 2 x (VIH (ac) - Vref) | Note 3 | V | 2 |
| VILdiff (ac) | Differential input low ac | Note 3 | 2 x (VIL (ac) - Vref) | V | 2 |

Notes:

- Used to define a differential signal slew-rate.
- For \overline{CK} use VIH/VIL (ac) of AADD/CMD and VREFCA; for DQS - \overline{DQS} , DQSL, \overline{DQSL} , DQSU, \overline{DQSU} use VIH/VIL (ac) of DQs and VREFDQ; if a reduced ac-high or ac-low levels is used for a signal group, then the reduced level applies also here.
- These values are not defined; however, the single-ended signals Ck , \overline{Ck} , DQS, \overline{DQS} , DQSL, \overline{DQSL} , DQSU, \overline{DQSU} need to be within the respective limits (VIH (dc) max, VIL (dc) min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specifications" on page 30.

Allowed time before ringback (tDVAC) for \overline{CK} and $DQS - \overline{DQS}$

| Slew Rate [V/ns] | DDR3-800/1066/1333/1600 | | | | | | DDR3-1866 | | | | | |

| < 1.0 | 0 | - | note | - | note | - | note | - | note | - | | |

note : Rising input differential signal shall become equal to or greater than VIHdiff(ac) level and Falling input differential signal shall become equal to or less than VIL(ac) level.

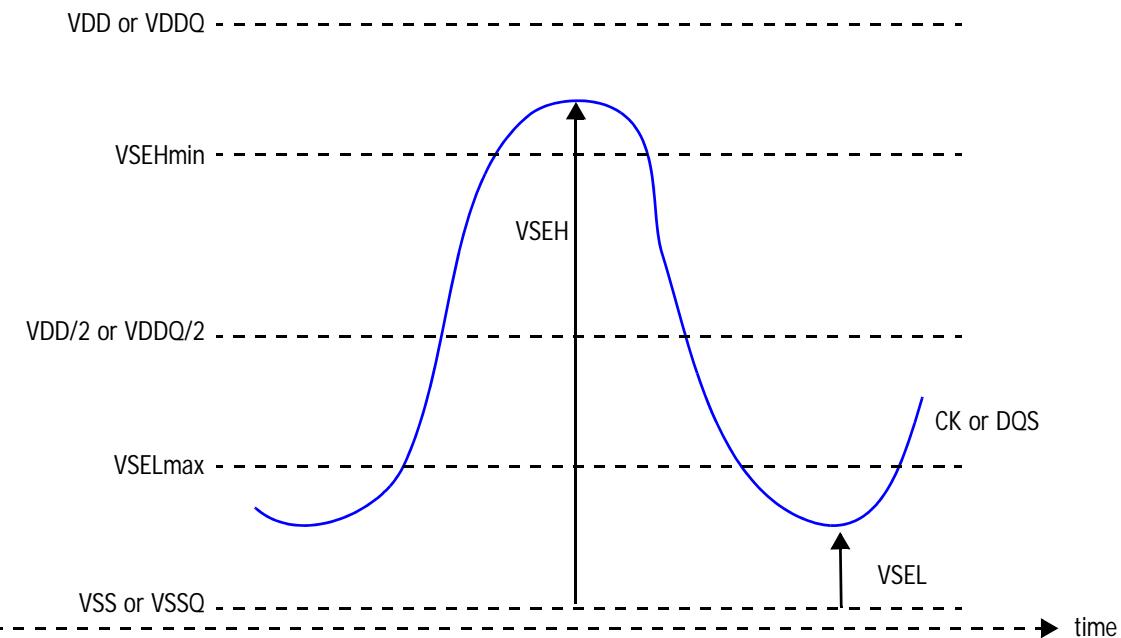

Single-ended requirements for differential signals

Each individual component of a differential signal (CK, DQS, DQSL, DQSU, \overline{CK} , \overline{DQS} , \overline{DQSL} , or \overline{DQSU}) also has to comply with certain requirements for single-ended signals.

CK and \overline{CK} have to approximately reach VSEHmin / VSELmax (approximately equal to the ac-levels (VIH (ac) / VIL (ac)) for ADD/CMD signals) in every half-cycle.

DQS, DQSL, DQSU, \overline{DQS} , \overline{DQSL} have to reach VSEHmin / VSELmax (approximately the ac-levels (VIH (ac) / VIL (ac)) for DQ signals) in every half-cycle preceding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g., if VIH.CA(AC150)/VIL.CA(AC150) is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals CK and \overline{CK} .

Single-ended requirements for differential signals.

Note that, while ADD/CMD and DQ signal requirements are with respect to Vref, the single-ended components of differential signals have a requirement with respect to VDD / 2; this is nominally the same. the transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach VSELmax, VSEHmin has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

Single-ended levels for CK, DQS, DQSL, DQSU, \overline{CK} , \overline{DQS} , \overline{DQSL} or \overline{DQSU}

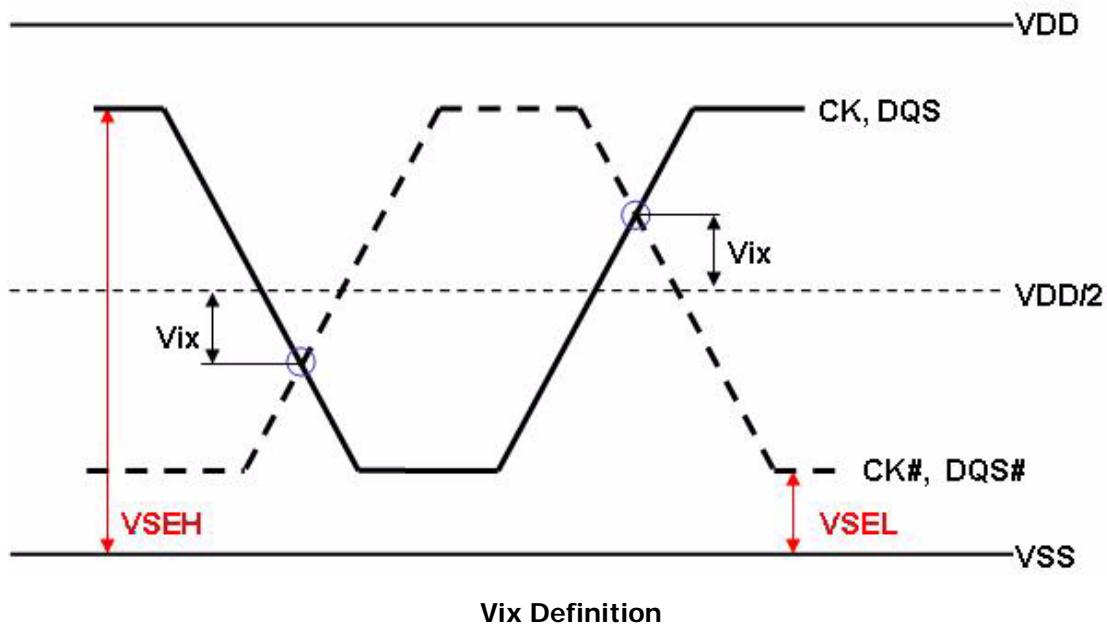

| Symbol | Parameter | DDR3-800, 1066, 1333, & 1600, 1866 | | Unit | Notes |
|--------|-------------------------------------|------------------------------------|---------------------|------|-------|
| | | Min | Max | | |
| VSEH | Single-ended high level for strobes | $(VDD / 2) + 0.175$ | Note 3 | V | 1,2 |
| | Single-ended high level for Ck, CK | $(VDD / 2) + 0.175$ | Note 3 | V | 1,2 |
| VSEL | Single-ended low level for strobes | Note 3 | $(VDD / 2) - 0.175$ | V | 1,2 |
| | Single-ended low level for CK, CK | Note 3 | $(VDD / 2) - 0.175$ | V | 1,2 |

Notes:

1. For CK, \overline{CK} use VIH/VIL (ac) of ADD/CMD; for strobes (DQS, \overline{DQS} , DQSL, \overline{DQSL} , DQSU, \overline{DQSU}) use VIH/VIL (ac) of DQs.
2. VIH (ac)/VIL (ac) for DQs is based on VREFDQ; VIH (ac)/VIL (ac) for ADD/CMD is based on VREFCA; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
3. These values are not defined; however, the single-ended signals Ck, \overline{CK} , DQS, \overline{DQS} , DQSL, \overline{DQSL} , DQSU, \overline{DQSU} need to be within the respective limits (VIH (dc) max, VIL (dc) min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specifications" on page 30.

Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK, CK# and DQS, DQS#) must meet the requirements in table below. The differential input cross point voltage VIX is measured from the actual cross point of true and complement signals to the midlevel between of VDD and VSS

Cross point voltage for differential input signals (CK, DQS)

| Symbol | Parameter | DDR3-800, 1066, 1333, 1600, 1866 | | Unit | Notes |
|---------------|--|----------------------------------|-----|------|-------|
| | | Min | Max | | |
| $V_{IX}(CK)$ | Differential Input Cross Point Voltage relative to VDD/2 for CK, \overline{CK} | -150 | 150 | mV | 2 |
| | | -175 | 175 | mV | 1 |
| $V_{IX}(DQS)$ | Differential Input Cross Point Voltage relative to VDD/2 for DQS, \overline{DQS} | -150 | 150 | mV | 2 |

Notes:

1. Extended range for V_{IX} is only allowed for clock and if single-ended clock input signals CK and \overline{CK} are monotonic with a single-ended swing VSEL / VSEH of at least $VDD/2 \pm 250$ mV, and when the differential slew rate of CK - \overline{CK} is larger than 3 V/ns.
2. The relation between Vix Min/Max and VSEL/VSEH should satisfy following.
 $(VDD/2) + Vix (\text{Min}) - VSEL \geq 25\text{mV}$
 $VSEH - ((VDD/2) + Vix (\text{Max})) \geq 25\text{mV}$

Slew Rate Definitions for Single-Ended Input Signals

See 7.5 "Address / Command Setup, Hold and Derating" in "DDR3 Device Operation" for single-ended slew rate definitions for address and command signals.

See 7.6 "Data Setup, Hold and Slew Rate Derating" in "DDR3 Device Operation" for single-ended slew rate definition for data signals.

Slew Rate Definitions for Differential Input Signals

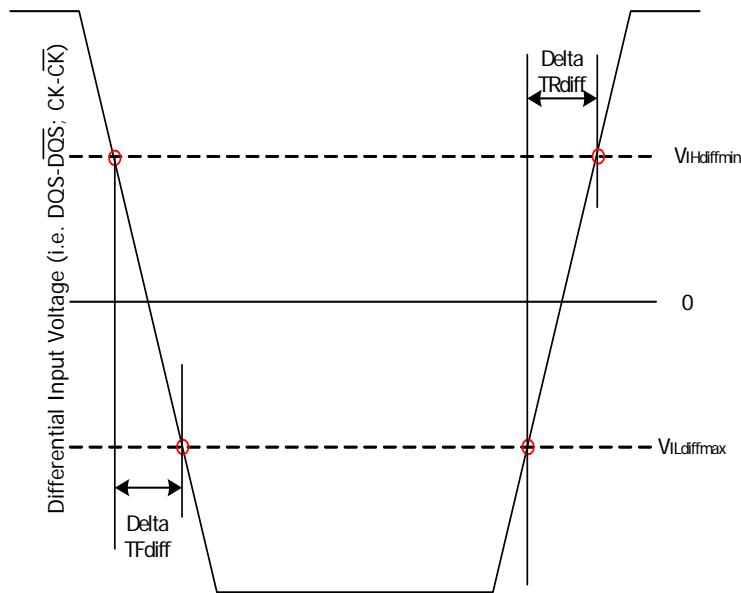

Input slew rate for differential signals (\overline{CK} , $\overline{\overline{CK}}$ and \overline{DQS} , $\overline{\overline{DQS}}$) are defined and measured as shown in table and figure below.

Differential Input Slew Rate Definition

| Description | Measured | | Defined by |
|---|-----------------|-----------------|--|
| | Min | Max | |
| Differential input slew rate for rising edge (\overline{CK} - $\overline{\overline{CK}}$ and \overline{DQS} - $\overline{\overline{DQS}}$) | $V_{ILdiffmax}$ | $V_{IHdiffmin}$ | $[V_{IHdiffmin} - V_{ILdiffmax}] / \Delta TR_{diff}$ |
| Differential input slew rate for falling edge (\overline{CK} - $\overline{\overline{CK}}$ and \overline{DQS} - $\overline{\overline{DQS}}$) | $V_{IHdiffmin}$ | $V_{ILdiffmax}$ | $[V_{IHdiffmin} - V_{ILdiffmax}] / \Delta TF_{diff}$ |

Notes:

The differential signal (i.e. \overline{CK} - $\overline{\overline{CK}}$ and \overline{DQS} - $\overline{\overline{DQS}}$) must be linear between these thresholds.

Differential Input Slew Rate Definition for DQS, \overline{DQS} and CK, \overline{CK}

AC & DC Output Measurement Levels

Single Ended AC and DC Output Levels

Table below shows the output levels used for measurements of single ended signals.

Single-ended AC and DC Output Levels

| Symbol | Parameter | DDR3-800, 1066, 1333, 1600, 1866 | Unit | Notes |
|--------------|---|-------------------------------------|------|-------|
| $V_{OH(DC)}$ | DC output high measurement level (for IV curve linearity) | $0.8 \times V_{DDQ}$ | V | |
| $V_{OM(DC)}$ | DC output mid measurement level (for IV curve linearity) | $0.5 \times V_{DDQ}$ | V | |
| $V_{OL(DC)}$ | DC output low measurement level (for IV curve linearity) | $0.2 \times V_{DDQ}$ | V | |
| $V_{OH(AC)}$ | AC output high measurement level (for output SR) | $V_{TT} + 0.1 \times V_{DDQ}$ | V | 1 |
| $V_{OL(AC)}$ | AC output low measurement level (for output SR) | $V_{TT} - 0.1 \times V_{DDQ}$ | V | 1 |

Notes:

1. The swing of $\pm 0.1 \times V_{DDQ}$ is based on approximately 50% of the static single ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$.

Differential AC and DC Output Levels

Table below shows the output levels used for measurements of single ended signals.

Differential AC and DC Output Levels

| Symbol | Parameter | DDR3-800, 1066, 1333, 1600, 1866 | Unit | Notes |
|------------------|---|-------------------------------------|------|-------|
| $V_{OHDiff(AC)}$ | AC differential output high measurement level (for output SR) | $+ 0.2 \times V_{DDQ}$ | V | 1 |
| $V_{OLDiff(AC)}$ | AC differential output low measurement level (for output SR) | $- 0.2 \times V_{DDQ}$ | V | 1 |

Notes:

1. The swing of $\pm 0.2 \times V_{DDQ}$ is based on approximately 50% of the static differential output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$ at each of the differential outputs.

Single Ended Output Slew Rate

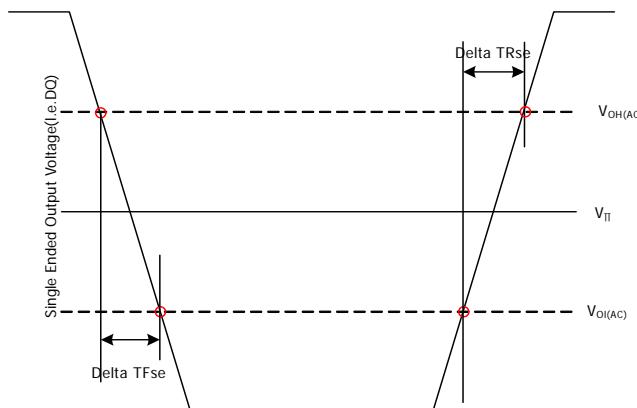

When the Reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between $V_{OL(AC)}$ and $V_{OH(AC)}$ for single ended signals are shown in table and figure below.

Single-ended Output slew Rate Definition

| Description | Measured | | Defined by |
|--|--------------|--------------|--|
| | From | To | |
| Single-ended output slew rate for rising edge | $V_{OL(AC)}$ | $V_{OH(AC)}$ | $[V_{OH(AC)} - V_{OL(AC)}] / \Delta T Rse$ |
| Single-ended output slew rate for falling edge | $V_{OH(AC)}$ | $V_{OL(AC)}$ | $[V_{OH(AC)} - V_{OL(AC)}] / \Delta T Fse$ |

Notes:

- Output slew rate is verified by design and characterisation, and may not be subject to production test.

Single Ended Output slew Rate Definition

Output Slew Rate (single-ended)

| | | DDR3-800 | | DDR3-1066 | | DDR3-1333 | | DDR3-1600 | | DDR3-1866 | | Units |
|-------------------------------|--------|----------|-----|-----------|-----|-----------|-----|-----------|-----|-----------|-----------------|-------|
| Parameter | Symbol | Min | Max | Min | Max | Min | Max | Min | Max | Min | Max | |
| Single-ended Output Slew Rate | SRQse | 2.5 | 5 | 2.5 | 5 | 2.5 | 5 | 2.5 | 5 | 2.5 | 5 ¹⁾ | V/ns |

Description: SR; Slew Rate

Q: Query Output (like in DQ, which stands for Data-in, Query-Output)

se: Single-ended Signals

For Ron = RZQ/7 setting

Note 1): In two cases, a maximum slew rate of 6V/ns applies for a single DQ signal within a byte lane.

Case 1 is a defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low or low to high) while all remaining DQ signals in the same byte lane are static (i.e. they stay at either high or low).

Case 2 is a defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low or low to high) while all remaining DQ signals in the same byte lane switching into the opposite direction (i.e. from low to high or high to low respectively). For the remaining DQ signal switching in to the opposite direction, the regular maximum limite of 5 V/ns applies.

Differential Output Slew Rate

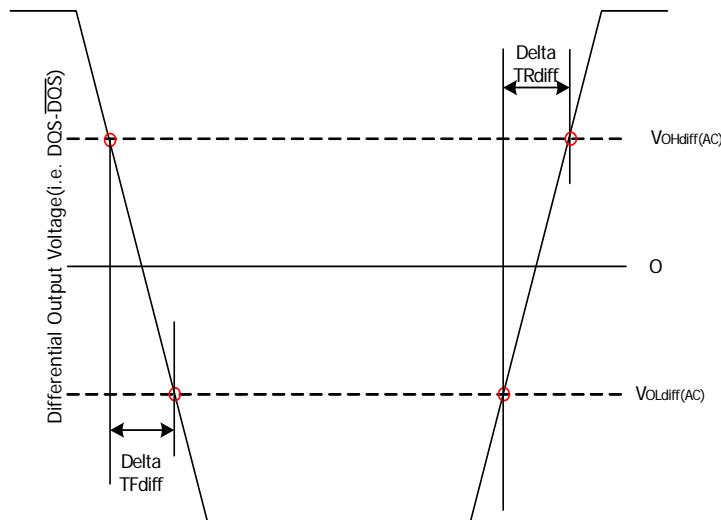

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between VOLdiff (AC) and VOHdiff (AC) for differential signals as shown in table and figure below.

Differential Output Slew Rate Definition

| Description | Measured | | Defined by |
|--|--------------------------|--------------------------|---|
| | From | To | |
| Differential output slew rate for rising edge | V _{OLdiff} (AC) | V _{OHdiff} (AC) | [V _{OHdiff} (AC)-V _{OLdiff} (AC)] / DeltaTRdiff |
| Differential output slew rate for falling edge | V _{OHdiff} (AC) | V _{OLdiff} (AC) | [V _{OHdiff} (AC)-V _{OLdiff} (AC)] / DeltaTFdiff |

Notes:

1. Output slew rate is verified by design and characterization, and may not be subject to production test.

Differential Output slew Rate Definition

Differential Output Slew Rate

For Ron = RZQ/7 setting

Reference Load for AC Timing and Output Slew Rate

Figure Below represents the effective reference load of 25 ohms used in defining the relevant AC timing parameters of the device as well as output slew rate measurements.

It is not intended as a precise representation of any particular system environment or a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers correlate to their production test conditions, generally one or more coaxial transmission lines terminated at the tester electronics.

Reference Load for AC Timing and Output Slew Rate

(CK, CK, DQ, DQS, DQS, DM)

See figure below for each parameter definition

Clock, Data, Strobe and Mask Overshoot and Undershoot Definition

Refresh parameters by device density

Refresh parameters by device density

| Parameter | RTT_Nom Setting | 512Mb | 1Gb | 2Gb | 4Gb | 8Gb | Units | Notes |
|--|-----------------|--|-----|-----|-----|-----|-------|-------|
| REF command ACT or REF command time | tRFC | 90 | 110 | 160 | 260 | 350 | ns | |
| Average periodic refresh interval | tREFI | $0^{\circ}\text{C} \leq T_{\text{CASE}} \leq 85^{\circ}\text{C}$ | 7.8 | 7.8 | 7.8 | 7.8 | us | |
| | | $85^{\circ}\text{C} < T_{\text{CASE}} \leq 95^{\circ}\text{C}$ | 3.9 | 3.9 | 3.9 | 3.9 | us | |

Notes:

1. Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this materia.

Standard Speed Bins

DDR3 SDRAM Standard Speed Bins include tCK, tRCD, tRP, tRAS and tRC for each corresponding bin.

DDR3-800 Speed Bins

For specific Notes See "Speed Bin Table Notes" on page 38.

| Speed Bin | | DDR3-800E | | Unit | Notes |
|--|-----------|---------------|----------------|-------------|--------------|
| CL - nRCD - nRP | | 6-6-6 | | | |
| Parameter | Symbol | min | max | | |
| Internal read command to first data | t_{AA} | 15 | 20 | ns | |
| ACT to internal read or write delay time | t_{RCD} | 15 | — | ns | |
| PRE command period | t_{RP} | 15 | — | ns | |
| ACT to ACT or REF command period | t_{RC} | 52.5 | — | ns | |
| ACT to PRE command period | t_{RAS} | 37.5 | $9 * t_{REFI}$ | ns | |
| CL = 6 | CWL = 5 | $t_{CK(AVG)}$ | 2.5 | 3.3 | 1, 2, 3 |
| Supported CL Settings | | 6 | | n_{CK} | |
| Supported CWL Settings | | 5 | | n_{CK} | |

DDR3-1066 Speed Bins

For specific Notes See "Speed Bin Table Notes" on page 38.

| Speed Bin | | DDR3-1066F | | Unit | Note |
|--|-----------|---------------|----------------|----------|------------------|
| CL - nRCD - nRP | | 7-7-7 | | | |
| Parameter | Symbol | min | max | | |
| Internal read command to first data | t_{AA} | 13.125 | 20 | ns | |
| ACT to internal read or write delay time | t_{RCD} | 13.125 | — | ns | |
| PRE command period | t_{RP} | 13.125 | — | ns | |
| ACT to ACT or REF command period | t_{RC} | 50.625 | — | ns | |
| ACT to PRE command period | t_{RAS} | 37.5 | $9 * t_{REFI}$ | ns | |
| CL = 6 | CWL = 5 | $t_{CK(AVG)}$ | 2.5 | 3.3 | ns 1, 2, 3, 6 |

| CL = 13 | CWL = 5,6,7,8 | $t_{CK(AVG)}$ | Reserved | | ns 4 |
| | CWL = 9 | $t_{CK(AVG)}$ | 1.07 | < 1.25 | ns 1, 2, 3 |
| Supported CL Settings | | 6, 7, 8, 9, 10, 11, 13 | | n_{CK} | |
| Supported CWL Settings | | 5, 6, 7, 8, 9 | | n_{CK} | |

Speed Bin Table Notes

Absolute Specification (T_{OPER} : $V_{DDQ} = V_{DD} = 1.5V \pm 0.075 V$):

1. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK(AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
2. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (3.0, 2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK(AVG) [ns], rounding up to the next 'Supported CL', where tCK(AVG) = 3.0 ns should only be used for CL = 5 calculation.
3. tCK(AVG).MAX limits: Calculate tCK(AVG) = tAA.MAX / CL SELECTED and round the resulting tCK(AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(AVG).MAX corresponding to CL SELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. 'Optional' settings allow certain devices in the industry to support this setting, however, it is not a mandatory feature. Refer to DIMM data sheet and/or the DIMM SPD information if and how this setting is supported.
6. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
9. Any DDR3-1866 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
10. DDR3 SDRAM devices supporting optional down binning to CL=7 and CL=9, and tAA/tRCD/tRP must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333H devices supporting down binning to DDR3-1066F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600K devices supporting down binning to DDR3-1333H or DDR3-1600F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin = 36 ns + 13.125 ns) for DDR3-1333H and 48.125ns (tRASmin + tRPmin = 35 ns + 13.125 ns) for DDR3-1600K.
11. DDR3 SDRAM devices supporting optional down binning to CL=11, CL=9 and CL=7, tAA/tRCD/tRPmin must be 13.125ns. SPD setting must be programmed to match. For example, DDR3-1866 devices supporting down binning to DDR3-1600 or DDR3-1333 or 1066 should program 13.125ns in SPD bytes for tAAmin(byte 16), tRCDmin(byte 18) and tRPmin(byte 20) is programmed to 13.125ns, tRCmin(byte 21,23) also should be programmed accordingly. For example, 47.125ns (tRASmin + tRPmin = 34ns + 13.125ns)

Environmental Parameters

| Symbol | Parameter | Rating | Units | Notes |
|---------------|---|---------------|--------------|--------------|
| T_{OPR} | Operating temperature (ambient) | 0 to +55 | °C | 3 |
| H_{OPR} | Operating humidity (relative) | 10 to 90 | % | |
| T_{STG} | Storage temperature | -50 to +100 | °C | 1 |
| H_{STG} | Storage humidity (without condensation) | 5 to 95 | % | 1 |
| P_{BAR} | Barometric Pressure (operating & storage) | 105 to 69 | K Pascal | 1, 2 |

Note:

1. Stress greater than those listed may cause permanent damage to the device. This is a stress rating only, and device functional operation at or above the conditions indicated is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Up to 9850 ft.
3. The designer must meet the case temperature specifications for individual module components.

IDD and IDDO Specification Parameters and Test Conditions

IDD and IDDO Measurement Conditions

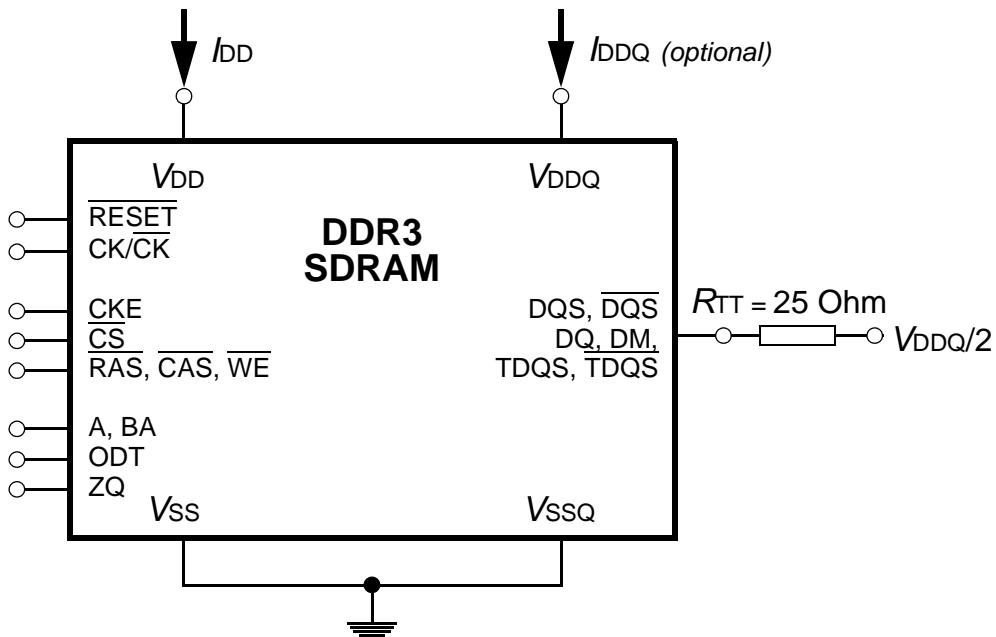

In this chapter, IDD and IDDO measurement conditions such as test load and patterns are defined. Figure below (Measurement Setup and Test Load for IDD and IDDO (optional) Measurements) shows the setup and test load for IDD and IDDO measurements.

- IDD currents (such as IDDO, IDD1, IDD2N, IDD2NT, IDD2P0, IDD2P1, IDD2Q, IDD3N, IDD3P, IDD4R, IDD4W, IDD5B, IDD6, IDD6ET and IDD7) are measured as time-averaged currents with all VDD balls of the DDR3 SDRAM under test tied together. Any IDDO current is not included in IDD currents.
- IDDO currents (such as IDDO2NT and IDDO4R) are measured as time-averaged currents with all VDDQ balls of the DDR3 SDRAM under test tied together. Any IDD current is not included in IDDO currents.

Attention: IDDO values cannot be directly used to calculate IO power of the DDR3 SDRAM. They can be used to support correlation of simulated IO power to actual IO power as outlined in the Figure below (Correlation from simulated Channel IO Power to actual Channel IO Power supported by IDDO Measurement). In DRAM module application, IDDO cannot be measured separately since VDD and VDDQ are using on merged-power layer in Module PCB.

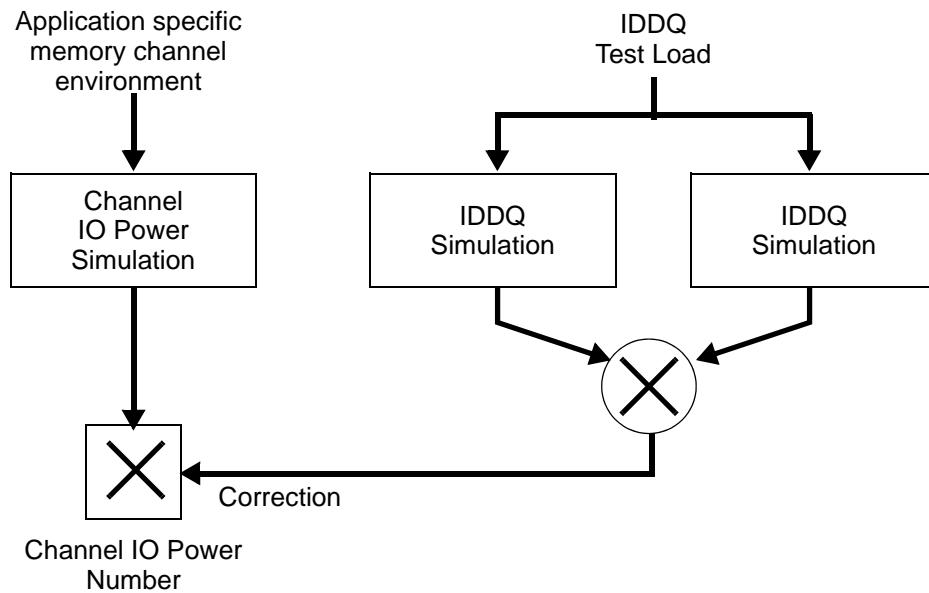

For IDD and IDDO measurements, the following definitions apply:

- "0" and "LOW" is defined as $V_{IN} \leq V_{ILAC(max)}$.
- "1" and "HIGH" is defined as $V_{IN} \geq V_{IHAC(max)}$.
- "MID_LEVEL" is defined as inputs are $V_{REF} = VDD/2$.
- Timing used for IDD and IDDO Measurement-Loop Patterns are provided in Table 1.
- Basic IDD and IDDO Measurement Conditions are described in Table 2.
- Detailed IDD and IDDO Measurement-Loop Patterns are described in Table 3 through Table 10.
- IDD Measurements are done after properly initializing the DDR3 SDRAM. This includes but is not limited to setting
 $RON = RZQ/7$ (34 Ohm in MR1);
 $Qoff = 0_B$ (Output Buffer enabled in MR1);
 $RTT_Nom = RZQ/6$ (40 Ohm in MR1);
 $RTT_Wr = RZQ/2$ (120 Ohm in MR2);
TDQS Feature disabled in MR1
- Attention: The IDD and IDDO Measurement-Loop Patterns need to be executed at least one time before actual IDD or IDDO measurement is started.
- Define $D = \{\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE}\} := \{\text{HIGH}, \text{LOW}, \text{LOW}, \text{LOW}\}$
- Define $\overline{D} = \{\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE}\} := \{\text{HIGH}, \text{HIGH}, \text{HIGH}, \text{HIGH}\}$

Measurement Setup and Test Load for IDD and IDDQ (optional) Measurements

[Note: DIMM level Output test load condition may be different from above]

Correlation from simulated Channel IO Power to actual Channel IO Power supported by IDDQ Measurement

| | | | | Assert and repeat above D Command until 4* nFAW - 1, if necessary | | | | | | | | | | | | | |

a) DM must be driven LOW all the time. DQS, DQS are used according to RD Commands, otherwise MID-LEVEL.

b) Burst Sequence driven on each DQ signal by Read Command. Outside burst operation, DQ signals are MID-LEVEL.

IDD Specifications (Tcase: 0 to 95°C)

* Module IDD values in the datasheet are only a calculation based on the component IDD spec. The actual measurements may vary according to DQ loading cap.
